Monitoring your hardware is not necessarily an overclocker's thing. Even if your device is stock, and is as it came through the factory's gates, it's wise to keep an eye on how it behaves, nonetheless. Temperatures are the most important factor within one's computer, and these have to be under control if you are to have a normal experience when utilizing your device. Portable HWMonitor Pro, just like its installable counterpart, is an application that can help monitor various system components, making use of their embedded sensors. Great for diagnosis If the installable application is great for monitoring, the portable version would seem great in a tool set of apps that are used to either diagnose or check during routine maintenance the functioning of a certain machine. Carrying it on a USB stick would be most wise. Even if you check your PC regularly, having it on a stick means you can also make use of its powers when accessing other machines. The application doesn't only show temperatures. It registers other information such as CPU clock speeds, wattage, and HDD space in percentages. Depending on the attached components, you can also receive feedback on internet speed and graphic card clocks. Monitoring while away is possible, like in the installable version, by recording for a certain period of time using the F5 button. Helpful in giving information Just like the name implies, this application is great at offering information about your PC's internal components. It can help with understanding why certain changes in your machine are beneficial, or the opposite. Thus, when making any changes, overclocking or not, it would be a great idea to make use of HWMonitor Pro's perks to quickly check that everything works fine within your machine. 26 reviews HWMonitor Pro is a portable monitoring application for PC hardware, developed by Advanced Micro Devices, Inc. It works with its own database of sensors and can be used either on a dedicated PC or as a USB drive. HWMonitor Pro User reviews about HWMonitor Pro Written by aforre I would give the thumbs up if this app allowed for more than just temps, as the temps are the only things it seems to be useful for. You can get a pretty good idea of how things are with CPU and HDD temps (after you get a decent sample of data to review) but you can't get any idea of the system clock speed or graphic card speed, which can be valuable as it can help point out what

Which would be the best gas as far as efficiency and cost goes? My property has an existing grease fire in an outbuilding. I'm replacing some gas appliances with nozzles and heaters and would like to replace the rest with natural gas if possible, but would like to know if this is a good idea. First question is: I have read in several threads that natural gas is more efficient than propane. Second question is: Which is better cost-wise? I know propane costs about \$2.50/gallon in my area. Natural gas is \$1.79. We are on a very limited budget, and I'd like to know before I waste money and then have to go back to the gas company to say that I can't afford to switch over. The building is old enough that we can put in a natural gas service line and a regulator (although I guess we could also just put in a small propane line and regulator if we are really worried about cost). Thanks. * 1.) which would be more efficient? * 2.) which is cheaper? _____ Been there. Done that. Have the tee-shirt. Thanks for the responses. First of all, I did my research. I found that 1.) propane is more efficient (according to the EPA) and
